

MEMORY CONTEXT TYPES

- decision

Why we chose X over Y (ADRs, trade-offs)
- domain

What things mean (requirements, glossary, regs)
- architecture

How the system is structured (topology, models)
- context

Who/when/where (team, timeline, budget)
- incident

What went wrong (postmortems, root cause)
- learning

What we measured (benchmarks, experiments)

ihub memories persist as .md files with YAML frontmatter — ihub create memory <name> -i to start — ihub pull memory <name> always installs to local memories/
